Curriculum Content: A serious Challenge For Value-Added Studies

- The Measurement Invariance Requirement
- Bias in the estimation of Teacher/School/District effects

Curriculum Content: A serious Challenge For Value-Added Studies

In both cases, the challenge is to the Strong Assumption underlying most value added research:

Content Homogeneity

both across grades and across classrooms, schools and districts.

Curriculum Content: A serious Challenge For Value-Added Studies

Vertical scaling – critical component for the validity of value added studies depends on the Measurement Invariance Assumption.

To measure change *“implies ... that ... identical scores on the two scales are to be interpreted as having identical meaning ...”* (Lord, 1963)

Put simply, the tests must measure the same thing at each time point for the measurement of change or growth.

Curriculum Content: A serious Challenge For Value-Added Studies

The Conceptual or Discipline based Challenge to the Measurement Invariance Assumption is that

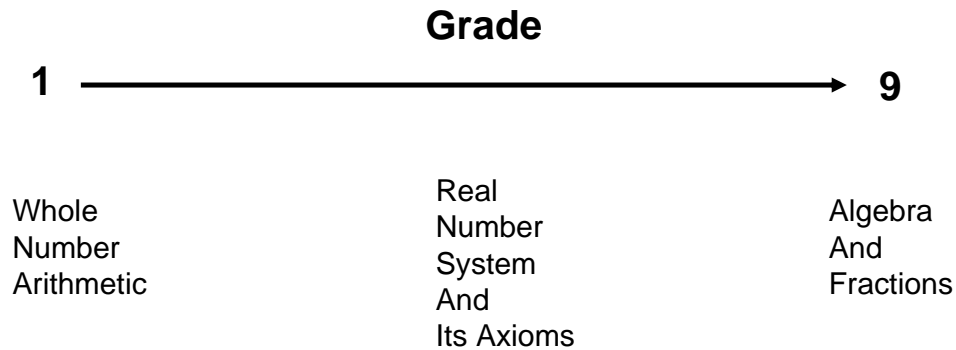

Math is *NOT* Math

Michigan Mathematics Standards

Number of Days Devoted to Each Content Area (Grade 1 to 8)

Michigan Mathematics Standards

Michigan Mathematics Standards

Grades 1 to 5 - Add, subtract, multiply, divide whole numbers and fractions

Grades 6 to 8 - Add, subtract, multiply, divide rational numbers

- Two tests defined on these domains might appear to be very similar.
- But from a mathematics point of view, we know them to be different.
- This would violate the Measurement Invariance requirement and seriously challenge the validity of vertical scaling.

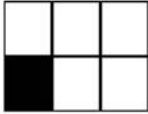

Michigan Math Standards – Fractions Grades 2-4

| Grade | Standard | Remarks |
|-------|--|---|
| 2 | PLACE 0 AND HALVES ($\frac{1}{2}$, $1\frac{1}{2}$, $2\frac{1}{2}$, ETC.) ON THE NUMBER LINE. | <ul style="list-style-type: none"> Have students use the ruler as a model of the number line. |
| 3 | KNOW THAT ONCE A WHOLE HAS BEEN FIXED OR DEFINED, FRACTIONS REFER TO EQUAL PARTS OF THE WHOLE. | <ul style="list-style-type: none"> The representation of the whole can be the length of an interval on the number line, the area of a rectangular strip or the area of a square. |
| | | <ul style="list-style-type: none"> Until a whole is made explicit in context, a fraction has no meaning. |
| 3 | RECOGNIZE, NAME AND USE EQUIVALENT FRACTIONS WITH DENOMINATORS 2, 4 AND 8. | <ul style="list-style-type: none"> Include the terms 'numerator' and 'denominator.' |
| | | <ul style="list-style-type: none"> In order to understand equivalent fractions, such as $\frac{1}{2} = \frac{2}{4}$, remind students that the whole is the unit. Without fixing the whole, equivalent fractions have no meaning. |
| | | <ul style="list-style-type: none"> Use strips. |
| 3 | ADD AND SUBTRACT FRACTIONS WITH THE SAME DENOMINATOR. | <ul style="list-style-type: none"> Emphasize the similarity of the addition and subtraction of fractions with the same operations on whole numbers. For example, $12 = 4 \times 3 = 2 \times 6 = 2 \times 2 \times 3$. Note this involves improper fractions. |
| 4 | LOCATE AND COMPARE FRACTIONS WITH DENOMINATORS OF 12 OR LESS ON THE NUMBER LINE. | <ul style="list-style-type: none"> Illustrate using fractional parts of rectangles. |
| 4 | ADD AND SUBTRACT FRACTIONS LESS THAN 1 AND WITH DENOMINATORS UP TO 12 OR EQUAL TO 100. | <ul style="list-style-type: none"> Exclude sums involving more than 2 different denominators. |

Michigan Math Standards – Fractions Grades 4-5

| Grade | Standard | Remarks |
|-------|---|---|
| | | <ul style="list-style-type: none"> Exclude sums where one denominator is not a multiple of the other. |
| | | <ul style="list-style-type: none"> Use the number line extensively. |
| | | <ul style="list-style-type: none"> Take verbal statements of a problem and have students write mathematically. Continue to use letters to represent unknowns. |
| 5 | GIVEN TWO FRACTIONS, EXPRESS THEM AS EQUIVALENT FRACTIONS WITH A COMMON DENOMINATOR BUT NOT NECESSARILY A LEAST COMMON DENOMINATOR (EMPHASIS ON DENOMINATORS EQUAL TO OR LESS THAN 12 OR EQUAL TO 100). | <ul style="list-style-type: none"> The easiest common denominator of $\frac{a}{b}$, $\frac{c}{d}$ is bd. Include reducing fractions to lowest terms. |
| 5 | ADD AND SUBTRACT FRACTIONS WITH UNLIKE DENOMINATORS; DENOMINATORS OF GIVEN FRACTIONS ARE EQUAL TO 1,2,...,11,12, OR 100. | <ul style="list-style-type: none"> Take verbal statements of a problem and have students write mathematically. |
| | | <ul style="list-style-type: none"> Include listing of equivalent fractions to identify fractions with common denominator. |
| | | <ul style="list-style-type: none"> Denominators of given fractions should not exceed 12. |
| | | <ul style="list-style-type: none"> Do not focus on the formula per se - students should not be required to memorize the formula in its abstract form, but to understand its use |
| | | <ul style="list-style-type: none"> Help students understand why this algorithm works. |

Michigan Math Standards – Fractions Grades 5

| Grade | Standard | Remarks |
|-------|--|---|
| 5 | KNOW THE MEANING OF THE PRODUCT OF TWO UNIT FRACTIONS IN TERMS OF AN AREA MODEL AS WELL AS THE PRODUCT OF A FRACTION BY A WHOLE NUMBER. | <ul style="list-style-type: none"> Emphasize fractions with small denominators for the purpose of drawing pictures. For example, $\frac{1}{2} \times \frac{1}{3} = \frac{1}{6}$  |
| | | <ul style="list-style-type: none"> Do not use pie models here. |
| | | <ul style="list-style-type: none"> Help students understand that multiplication of a number by a fraction can result in a smaller number. |
| 5 | UNDERSTAND A FRACTION AS A STATEMENT OF DIVISION. | <ul style="list-style-type: none"> Show that $1 \div 3 = 1/3$ by examining:  <p>where the area of the square is defined as the whole for interpreting the fraction. The picture represents 1 part of 3, $1/3$ and $1 \div 3$.</p> |

Michigan Math Standards – Fractions Grades 5

| Grade | Standard | Remarks |
|-------|----------|---|
| | | <ul style="list-style-type: none"> Show that $2 \div 3 = 2/3$ by examining,  <p>where the area of one square is defined as the whole for interpreting the fraction $2/3$. Interpret $2 \div 3$ as the size of a part that results when 2 units are divided into 3 equal parts.</p> |
| | | <ul style="list-style-type: none"> For example, $2/3$ is the division of 2 by 3 and can be described by the property that 3 times $2/3$ is 2. |
| | | <ul style="list-style-type: none"> For example, you have 3 cookies to divide among 4 people. Each person gets $3/4$ of a cookie. Therefore, $3 \div 4 = 3/4$. |
| | | <ul style="list-style-type: none"> For example, recognize that $2/3$ implies 2 out of 3 parts, but also $2 \div 3$ in the general sense of partitive division. |
| | | <ul style="list-style-type: none"> Include conversion between fractions and decimals. |

Michigan Math Standards – Fractions Grades 6

| Grade | Standard | Remarks |
|-------|---|--|
| 6 | DIVIDE ANY TWO FRACTIONS INCLUDING MIXED NUMBERS. | <ul style="list-style-type: none"> Emphasize that, as in the case of whole numbers, division of fractions is just a rewrite of the corresponding statement about multiplication of fractions. Thus, if A,B,C are fractions, then $A \div B = C$ is another way of writing $A = C \times B$. Thus, $\frac{a}{b} \div \frac{c}{d} = \frac{ad}{bc} \rightarrow \frac{ad}{bc} \times \frac{c}{d} = \frac{a}{b}$ And we see that ad/bc is the quantity which, when multiplied by c/d gives a/b. |
| | | <ul style="list-style-type: none"> There will be a tendency to simply memorize the formula "invert and multiply." It is very important that this formula be explained and justified, not just memorized. |
| | | <ul style="list-style-type: none"> Take verbal statements of a problem and have students write mathematically. |

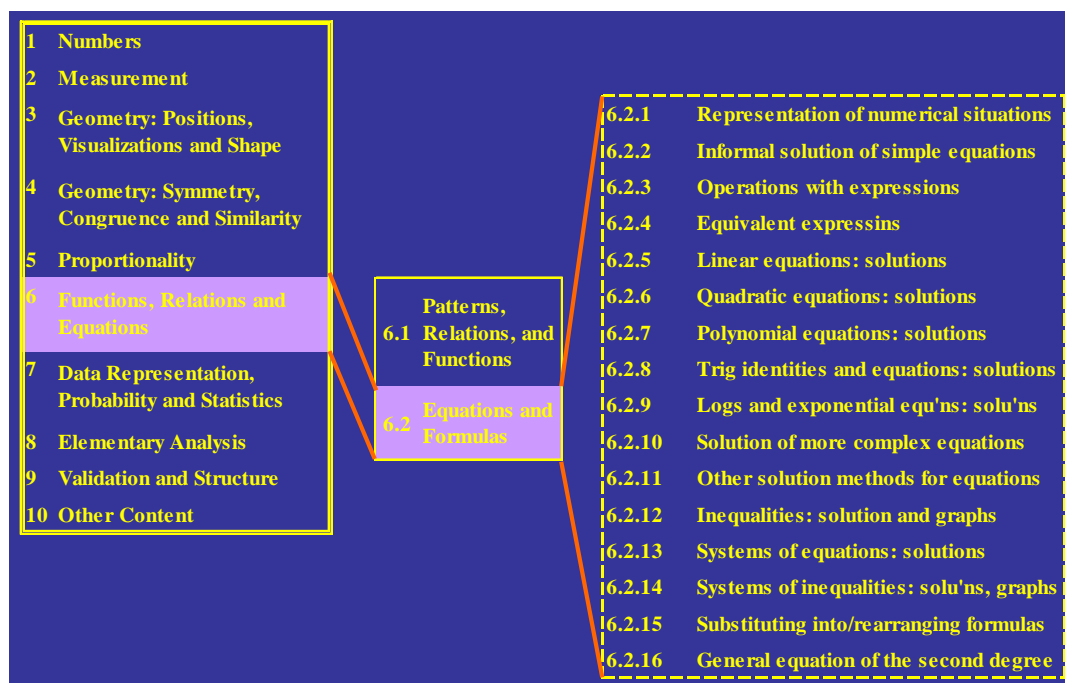

TIMSS Document Analysis

- Designed for Grades K - 12 Materials
 - Curriculum Guides
 - Textbooks
 - Tests
- TIMSS Curriculum Framework
 - Mathematics
 - Sciences
 - Curriculum Standards and Guides

TIMSS Framework

- Examines content and performance expectation
- Content examined:
 - **What** topics are intended?
 - **When** are topics intended?
- Performance expectation examined:
 - What student performances are expected?
- Procedure is designed to be **Low Inference**

TIMSS Mathematics Framework

Curriculum Statistical Indicators

- Cumulative signatures of test items
 - Content Topic and Performance Expectation Signature for each item
- Derived Percent of coverage for each content topic

General Topic Trace Mapping

- Part of Data Collection Procedure for Curriculum Analysis
- Each country, district, state, reported when, how long each topic was included in the K-12 curriculum
 - When topic was introduced
 - When topic was focused
- International Grade Placement Index
 - “Average” or composite curriculum

The Empirical Challenge is ...

A math test is a *NOT* math test

Are test scores sensitive to curriculum?

Distributions of country ranks across mathematics sub-topics

Results of a Simulation Study of Longitudinal Vertical Scaling ...

“... This study demonstrates mathematically that the use of such “construct-shifting” vertical scales in longitudinal, value-added models introduces remarkable distortions in the value-added estimates of the majority of educators. These distortions include (1) identification of effective teachers/schools as ineffective (and vice versa) simply because their students’ achievement is outside the developmental range measured well by “appropriate” grade-level tests, and (2) the attribution of prior teacher/school effects to later teachers/schools. Therefore, theories, models, policies, rewards, and sanctions based upon such value-added estimates are likely to be invalid because of distorted conclusions about educator effectiveness in eliciting student growth.”
(Martineau, 2004)

Curriculum Effect Missing ...

“ ...find evidence ...suggesting a contextual effect could result in systematic error (bias) when they are omitted from the model ...”

(Ballou, Sanders and Wright, 2003)

Variation in the mathematics content index (IGP) in schools having multiple tracks and schools having single tracks.

| Source | Single-Track Schools | | Multiple – Track Schools | |
